

THIRSTY VEHICLE!

How to estimate the vehicle expenses

The cost of fuel for our cars and scooters continues to rise, impacting our daily expenses more than ever. The amount we spend on fuel largely depends on two main factors: the specific characteristics of our vehicle—such as engine efficiency, fuel type, and size—and the distances we travel. These factors cause fuel expenses to fluctuate, making it essential to track our usage closely. By monitoring our fuel consumption and applying some straightforward calculations, we can estimate our overall fuel use. This, in turn, allows us to gain a clearer understanding of the associated costs and to budget more effectively. With a bit of effort and awareness, we can make more informed decisions about how we drive, potentially saving both fuel and money over time.

Overview “THIRSTY VEHICLE”

Main information	
Content	Natural and decimal numbers; Multiplication, division and addition
Target group	Adults and young adults Learners: <ul style="list-style-type: none"> • With a basic level of mathematics, able to do simple operations and to relate several numbers to each other; • Use and/or own a vehicle that they use almost every day
Learning intention	2UE+
Duration	Presentation developed by the teacher
Material and resources	from 6 to 12 learners
Group size	Numeracy for personal and private purposes
Problem statement	Sensitive or not to the issue of global warming due to pollution, by now we know that it would be better to limit the heavy use of private motor vehicles, yet it is not always possible to give up one's means of transportation. Being equipped with your own vehicle can be a convenience but also a great expense. The ongoing expense is due to the consumption of our means of transportation, which is due to multiple factors. By evaluating one at a time and relating them, it is possible to get an estimate.
Learning outcomes and results	The students are able to estimate monthly or weekly consumption based on distances most traveled, vehicle's characteristics and price of fuel. They will examine factors that affect fuel use, like vehicle type, engine efficiency, driving habits, and distance traveled. By calculating their vehicle's fuel consumption and costs, students will gain insight into the ongoing expenses of ownership. Using real or hypothetical data, they will perform calculations to estimate their fuel use and its financial impact. Students will also explore alternative transportation options, considering the pros and cons of each for saving money and reducing environmental impact

Working plan

Time (lessons)	Description of content/activities	Material	Methodical and didactic information ¹
45'	<p>1. Discover and Discussion</p> <p>The problem is presented to the learners, who, being adults or young adults, can actively confront and expose the various aspects that will be addressed</p> <p>It is important that at the end of this phase you have collected all the elements that will be useful in obtaining the final estimate of expenditure (i.e., fuel price, vehicle characteristics, and distance traveled).</p> <p>[alternative]</p> <p><i>The teacher may have previously researched some data, such as the average price of fuel, or decide to construct this research with the learners on the spot. Possibly the activity can also begin simply with the statement of the problem and then the learners are made to work in small groups and, with the necessary means at their disposal, are themselves to create material that they will share with the other groups at a later stage (in this case the time required will be longer).</i></p>	see appendix 1	Active learning Cooperative learning
30'+	<p>2.Relation between data and calculation</p> <p>Knowing the data influencing the cost learners first work to estimate their expenditure and then perform the same procedure with the calculator.</p>		Individual work

¹ for description and explanation of kinds of tasks, HITs and other background information please consult the teacher's/user's guide

45'+	<p><u>3.Exchange</u> To allow learners to practice more on the topic, personal or fictional situations from <u>step 2</u> are collected and shared with the rest of the class. everyone will have a chance to practice on different situations.</p>		Questioning Active learning
30'	<p><u>4.Discussion</u></p> <p>The concluding phase involves an open discussion related to the sharing of one's thoughts on the topic, the adherence of these to the initial hypotheses, and the awareness of one's abilities regarding the solving of the problems presented.</p> <p>This final phase can also be the moment to involve the learners in a discussion session where they compare different transportation options. First, students work in small groups to gather information on public transit, biking, and carpooling, focusing on aspects like cost, environmental impact, and practicality. Then, each group presents their findings and discusses the advantages and disadvantages of each option with the class. Finally, the class works together to develop criteria for determining the best transportation option for different situations.</p>		Feedback
